## **RFC 9201**

# Additional OAuth Parameters for Authentication and Authorization for Constrained Environments (ACE)

#### **Abstract**

This specification defines new parameters and encodings for the OAuth 2.0 token and introspection endpoints when used with the framework for Authentication and Authorization for Constrained Environments (ACE). These are used to express the proof-of-possession (PoP) key the client wishes to use, the PoP key that the authorization server has selected, and the PoP key the resource server uses to authenticate to the client.

#### Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc9201.

## **Copyright Notice**

**Author's Address** 

## 1. Introduction

The Authentication and Authorization for Constrained Environments (ACE) specification [RFC9200] requires some new parameters for interactions with the OAuth 2.0 [RFC6749] token and introspection endpoints, as well as some new claims to be used in access tokens. These parameters and claims can also be used in other contexts and have therefore been put into a dedicated document to facilitate their use in a manner independent of [RFC9200].

Note that although all examples are shown in Concise Binary Object Representation (CBOR) [RFC8949], JSON [RFC8259] MAY be used as an alternative for HTTP-based communications, as specified in [RFC9200].

## 2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

Readers are assumed to be familiar with the terminology from [RFC9200], especially the terminology for entities in the architecture such as client (C), resource server (RS), and authorization server (AS).

Terminology from [RFC8152] is used in the examples, especially COSE\_Key, which is defined in Section 7 of [RFC8152].

Note that the term "endpoint" is used here following its OAuth 2.0 [RFC6749] definition, which is to denote resources such as token and introspection at the AS and authz-info at the RS. The Constrained Application Protocol (CoAP) [RFC7252] definition, which is "[a]n entity participating in the CoAP protocol", is not used in this specification.

# 3. Parameters for the Token Endpoint

This section defines additional parameters for the interactions with the token endpoint in the ACE framework [RFC9200].

#### 3.1. Client-to-AS Request

This section defines the req\_cnf parameter allowing clients to request a specific PoP key in an access token from a token endpoint in the ACE framework [RFC9200]:

req\_cnf

**OPTIONAL**. This field contains information about the key the client would like to bind to the access token for proof of possession. It is **RECOMMENDED** that an AS rejects a request containing a symmetric key value in the req\_cnf field (kty=Symmetric), since the AS is expected to be able to generate better symmetric keys than a constrained client. (Note: this does not apply to key identifiers referencing a symmetric key.) The AS **MUST** verify that the client really is in possession of the corresponding key. Profiles of [RFC9200] using this specification **MUST** define the PoP method used by the AS if they allow clients to use this request parameter. Values of this parameter follow the syntax and semantics of the cnf claim either from Section 3.1 of [RFC8747] for CBOR-based interactions or from Section 3.1 of [RFC7800] for JSON-based interactions.

Figure 1 shows a request for an access token using the req\_cnf parameter to request a specific public key as a PoP key. The content is displayed in CBOR diagnostic notation with line breaks for better readability.

```
Header: POST (Code=0.02)
Uri-Host: "as.example.com"
Uri-Path: "token"
Content-Format: application/ace+cbor
Payload:
   / req_cnf / 4 : {
     / COSE_Key / 1 : {
     / kty / 1 : 2 /EC2/,
/ kid / 2 : h'11',
     / crv / -1 : 1 /P-256/,
            -2 : h'BAC5B11CAD8F99F9C72B05CF4B9E26D24
     / x /
                    4DC189F745228255A219A86D6A09EFF'
     / y / -3 : h'20138BF82DC1B6D562BE0FA54AB7804A3
                    A64B6D72CCFED6B6FB6ED28BBFC117E
      }
   }
 }
```

Figure 1: Example Request for an Access Token Bound to an Asymmetric Key

#### 3.2. AS-to-Client Response

This section defines the following additional parameters for an AS response to a request to the token endpoint:

cnf

**REQUIRED** if the token type is "pop" and a symmetric key is used. **MAY** be present for asymmetric PoP keys. This field contains the PoP key that the AS selected for the token. Values of this parameter follow the syntax and semantics of the cnf claim either from Section 3.1 of [RFC8747] for CBOR-based interactions or from Section 3.1 of [RFC7800] for JSON-based interactions. See Section 5 for additional discussion of the usage of this parameter.

rs\_cnf

**OPTIONAL** if the token type is "pop" and asymmetric keys are used. **MUST NOT** be present otherwise. This field contains information about the public key used by the RS to authenticate. If this parameter is absent, either the RS does not use a public key or the AS knows that the RS can authenticate itself to the client without additional information. Values of this parameter follow the syntax and semantics of the cnf claim either from Section 3.1 of [RFC8747] for CBOR-based interactions or from Section 3.1 of [RFC7800] for JSON-based interactions. See Section 5 for additional discussion of the usage of this parameter.

Figure 2 shows an AS response containing a token and a cnf parameter with a symmetric PoP key.

```
Header: Created (Code=2.01)
Content-Format: application/ace+cbor
Payload:
{
    / access_token / 1 : h'4A5015DF686428/...
        (remainder of CWT omitted for brevity;
        CWT contains COSE_Key in the "cnf" claim)/',
        / cnf / 8 : {
        / COSE_Key / 1 : {
            / kty / 1 : 4 / Symmetric /,
            / kid / 2 : h'DFD1AA97',
            / k / -1 : h'849B5786457C1491BE3A76DCEA6C427108'
        }
    }
}
```

Figure 2: Example AS Response with an Access Token Bound to a Symmetric Key

Figure 3 shows an AS response containing a token bound to a previously requested asymmetric PoP key (not shown) and an rs\_cnf parameter containing the public key of the RS.

Figure 3: Example AS Response Including the RS's Public Key

## 4. Parameters for the Introspection Endpoint

This section defines the use of CBOR instead of JSON for the cnf introspection response parameter specified in Section 9.4 of [RFC8705].

If CBOR is used instead of JSON in an interaction with the introspection endpoint, the AS **MUST** use the parameter mapping specified in Table 1 and the value must follow the syntax of cnf claim values from Section 3.1 of [RFC8747].

Figure 4 shows an AS response to an introspection request including the cnf parameter to indicate the PoP key bound to the token.

Figure 4: Example Introspection Response

#### 5. Confirmation Method Parameters

The confirmation method parameters are used in [RFC9200] as follows:

- req\_cnf in the access token request C -> AS, **OPTIONAL** to indicate the client's raw public key or the key identifier of a previously established key between the C and RS that the client wishes to use for proof of possession of the access token.
- cnf in the token response AS -> C, **OPTIONAL** if using an asymmetric key or a key that the client requested via a key identifier in the request. **REQUIRED** if the client didn't specify a req\_cnf and symmetric keys are used. Used to indicate the symmetric key generated by the AS for proof of possession of the access token.
- cnf in the introspection response AS -> RS, **REQUIRED** if the access token that was subject to introspection is a PoP token, absent otherwise. Indicates the PoP key bound to the access token.
- rs\_cnf in the token response AS -> C, **OPTIONAL** to indicate the public key of the RS if it uses one to authenticate itself to the client and the binding between the key and RS identity is not established through other means.

Note that the COSE\_Key structure in a confirmation claim or parameter may contain an alg or key\_ops parameter. If such parameters are present, a client MUST NOT use a key that is incompatible with the profile or PoP algorithm according to those parameters. An RS MUST reject a proof of possession using such a key with a response code equivalent to the CoAP code 4.00 (Bad Request).

If an access token is issued for an audience that includes several RSs, the rs\_cnf parameter MUST NOT be used, since the client cannot determine for which RS the key applies. This document recommends to specify a different endpoint that the client can use to acquire RS authentication keys in such cases. The specification of such an endpoint is out of scope for this document.

# 6. CBOR Mappings

If CBOR is used, the new parameters and claims defined in this document **MUST** be mapped to CBOR types, as specified in Table 1, using the given integer abbreviation for the map key.

Name	CBOR Key	Value Type	Usage
req_cnf	4	map	token request
cnf	8	map	token response
cnf	8	map	introspection response
rs_cnf	41	map	token response

Table 1: CBOR Mappings for New Parameters and Claims

## 7. Requirements When Using Asymmetric Keys

An RS using asymmetric keys to authenticate to the client MUST NOT hold several different asymmetric key pairs applicable to the same authentication algorithm. For example, when using DTLS, the RS MUST NOT hold several asymmetric key pairs applicable to the same cipher suite. The reason for this restriction is that the RS has no way of determining which key to use before the client's identity is established. Therefore, authentication attempts by the RS could randomly fail based on which key the RS selects, unless the algorithm negotiation produces a unique choice of key pair for the RS.

# 8. Security Considerations

This document is an extension to [RFC9200]. All security considerations from that document apply here as well.

# 9. Privacy Considerations

This document is an extension to [RFC9200]. All privacy considerations from that document apply here as well.

## 10. IANA Considerations

## 10.1. OAuth Parameter Registration

This section registers the following parameters in the "OAuth Parameters" registry [IANA.OAuthParameters]:

Name: req\_cnf

Parameter Usage Location: token request

Change Controller: IETF

Reference: Section 5 of RFC 9201

Name: rs\_cnf

Parameter Usage Location: token response

Change Controller: IETF

Reference: Section 5 of RFC 9201

Name: cnf

Parameter Usage Location: token response

Change Controller: IETF

Reference: Section 5 of RFC 9201

## 10.2. OAuth Parameters CBOR Mappings Registration

This section registers the following parameter mappings in the "OAuth Parameters CBOR Mappings" registry established in Section 8.10 of [RFC9200].

Name: req\_cnf CBOR Key: 4 Value Type: map

Reference: Section 3.1 of RFC 9201 Original Specification: RFC 9201

Name: cnf CBOR Key: 8 Value Type: map

Reference: Section 3.2 of RFC 9201 Original Specification: RFC 9201

Name: rs\_cnf CBOR Key: 41 Value Type: map Reference: Section 3.2 of RFC 9201 Original Specification: RFC 9201

## 10.3. OAuth Token Introspection Response CBOR Mappings Registration

This section registers the following parameter mapping in the "OAuth Token Introspection Response CBOR Mappings" registry established in Section 8.12 of [RFC9200].

Name: cnf CBOR Key: 8 Value Type: map

Reference: Section 4 of RFC 9201 Original Specification: [RFC8705]
