SDP for the WebRTC
draft-nandakumar-rtcweb-sdp-01

Abstract

The Web Real-Time Communication (WebRTC) **[WEBRTC]** working group is charged to provide protocol support for direct interactive rich communication using audio, video and data between two peers' web browsers. With in the WebRTC framework, Session Description protocol (SDP) **[RFC4566]** is used for negotiating session capabilities between the peers. Such a negotiataion happens based on the SDP Offer/Answer exchange mechanism described in the RFC 3264 **[RFC3264]**.

This document serves a introductory purpose in describing the role of SDP for the most common WebRTC use-cases.

Table of Contents

---

1. Introduction

Javascript Session Exchange Protocol(JSEP) **[JSEP]** specifies a generic protocol needed to generate **[RFC3264]** offers and answers negotiated between the WebRTC peers for setting up, updating and tearing down a multimedia session. For this purpose, SDP is used to construct **[RFC3264]** offers/answers for describing (media and non-media) streams as appropriate for recipients of a session description to participate in the session.

The remainder of this document is organized as follows: Section 3 and 4 provide an overview of SDP and the Offer/Answer exchange mechanism. Section 5 and 6 provide sample SDP usages for the most common WebRTC use-cases.

---

2. Terminology

TOC

The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in **[RFC2119]**.

---

3. SDP and the WebRTC

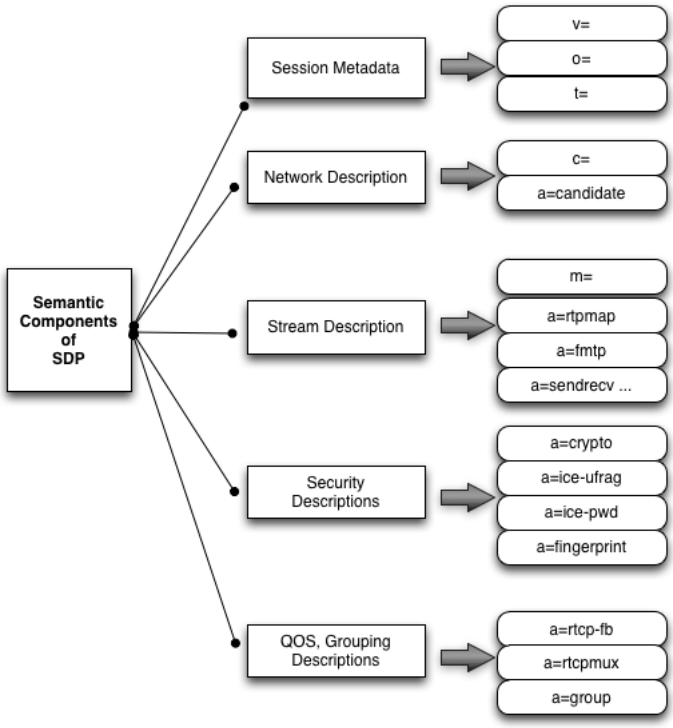
TOC

The purpose of this section is to provide a general overview of SDP and its components. For a more in-depth understanding, the readers are advised to refer to the **[RFC4566]**.

The Session Description Protocol (SDP) **[RFC4566]** describes multimedia sessions,which can be audio,video, whiteboards,fax,modem, and other streams. It provides a general purpose,standard representation to describe various aspects of multimedia session such as media capabilities,transport addresses and related metadata in a transport agnostic manner,for the purposes of session announcement,session invitation and parameter negotiation.

As of today SDP is widely used in the context of Session Initiation Protocol,Real-time Transport Protocol, and Real-time Streaming Protocol.

Below figure introduces high-level breakup of SDP into components that semantically describe a multimedia session, in our case,say,a WebRTC session **[WEBRTC]**. It by no means captures everything about SDP and hence, should be used for informational purposes only.



[WEBRTC] proposes JavaScript application to fully control the signaling plane of a multimedia session as described in the JSEP specification **[JSEP]**. JSEP provides mechanisms to create session characterisation and media definition information to conduct the session based on SDP exchanges.

In this context,SDP serves two purposes:

Provide grammatical structure syntatically

Semantically convey partipant's intention and capabilities.

4. Offer/Answer and the WebRTC

This section introduces SDP Offer/Answer Exchange mechanism mandated by WebRTC for negotitating session capabilities while setting up,updating and tearing down a WebRTC session. This section is intentionally brief in nature and interested readers are recommended to **[RFC3264]** for specific details on the protocol operation.

The Offer/Answer **[RFC3264]** model specifies rule for the bilateral exchange of Session Description Protocol (SDP) messages for creation of multimedia streams.It defines protocol with involved participants exchanging desired session characteristics from each others perspective modelled on SDP to negotiate the session between them.

In the most basic form,the protocol operation begins by one of the participants sending an initial SDP offer describing its intent to start a multimedia communication session. The participant receiving the offer MAY generate an SDP answer accepting the offer or it MAY reject the offer. If the session is accepted the offer answer model guarantees a common view of the multimedia session between the participants.

At any time, either participant MAY generate a new SDP offer that updates the session in progress.

With in the context of WebRTC, the Offer/Answer model defines the state-machinery for WebRTC peers to negotiate session descriptions between them during initial setup stages as well as for eventual session updates. Javascript Session Establishment Protocol specification **[JSEP]** for WebRTC provides the mechanism for generating **[RFC3264]** SDP offers and answers in order for both sides of the session to agree upon details such as list of media formats to be sent/received, bandwidth information, crypto parameters, transport parameters, for example.

The following sections provide samples of SDP message details and exchanges for the most common WebRTC usecases.

5. WebRTC Session Description Examples

A typical web based real-time multimedia communication session can be characterized as below:

It has zero or more Audio only,Video only or Audio/Video Media streams

MAY contain zero or more non-media data streams

All the streams are secured with DTLS/SRTP

ICE processing for NAT Traversal

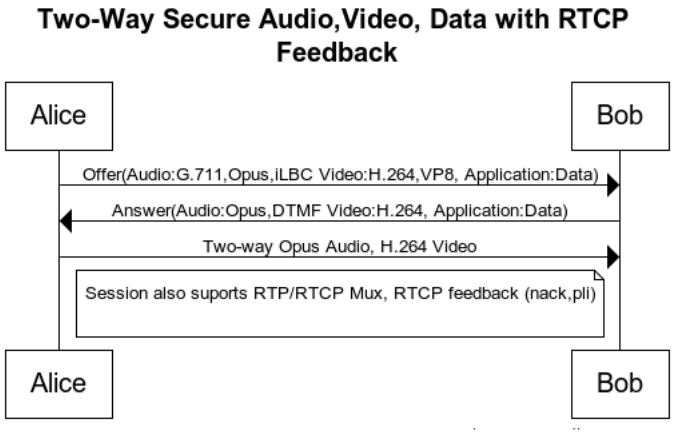
Sessions over IPv4-only, IPv6-only, dual-stack based clients.

As mentioned earlier **[WEBRTC]** proposes using SDP based Offer/Answer model to negotiate multimedia session between peers' browsers Building on the concepts from the previous sections, the following subsections attempts to describe the usage of SDP for the most common WebRTC use-cases.

In all the use-cases, Alice and Bob are assumed to be the WebRTC peers unless mentioned otherwise. Pointers to appropriate RFCs and notes are provided, wherever necessary,agains the SDP lines.

5.1. Secure Two-Way Audio,Video and Data with RTCP Feedback

This use-case allows two users to participate in a two-way communication session securely on their WebRTC enabled Web browsers.



More specifically, this use-case demonstrates following aspects of a WebRTC session

- SRTP with DTLS based encryption
- RTP and RTCP Muxing
- RTCP based feedback and reduced size support
- ICE processing for NAT Traversal
- Audio Codec Offered : PCMU, Opus, iLBC
- Audio Codec Answered : Opus
- Video Codecs Offered: H.264, VP8
- Video Codecs Answered: H.264
- Data Channel Support

The tables (5.1 and 5.2) below capture in detail, the initial SDP Offer and Answer messages exchanged.

The exact SDP parameters specified for Data-Channel is still under the WG discussion and is expected to be updated once a decission is made.

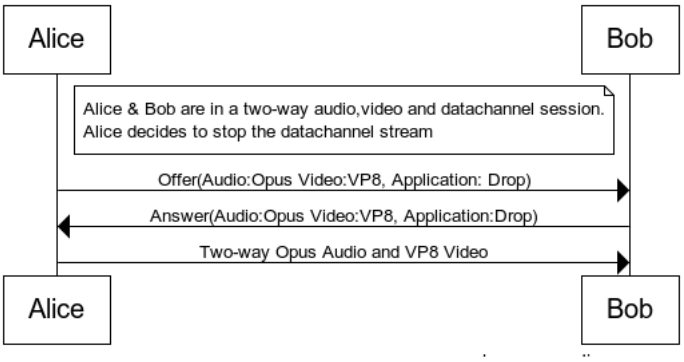
TOC

5.2. Secure Two-way Audio,Video,Data and remove data stream

This scenario builds upon from the usecase in the section 5.1 It extends by Alice removing data-stream once the session is in progress.

WebRTC Session (Audio,Video,Datachannel) - Drop Datachannel



As a precondition, A Two-Way Audio,Video and Data Session is already setup.

TOC

5.3. Secure Two-Way Audio,Video w/BUNDLE Support Unknown

This use-case demonstrates a successfull audio and video multiplexing scenario with SDP BUNDLE negotiation when the Alice is unsure of the Bob's BUNDLE support. Table below also illustrates, additional SDP Offer/Answer exchange once the Alice figures that a 2-way BUNDLE session can be setup.

Table 18: 5.7 SDP Updated Answer

5.8. Successful Simulcast with 2 Encodings, 2 Cameras

TOC

The SDP Offer/Answer exchange illustrates simulcasting use-case, where Alice 2 cameras with 2 encoding options per camera.

5.9. Successful SVC Video Stream

In the example Offer/Answer exchange mechanism below, Alice Offers 3 media descriptions of type video along with the layered decoding depencies between them. On the other hand, Bob accepts only 2 of 3 Operation points offered by Alice.

Table 22: 5.9 SDP Answer

TOC

6. WebRTC <-> Legacy Interop Examples

In this section, we attempt to provide session descriptions showcasing inter-operability between a WebRTC end-point and a Legacy VOIP end-point. The ideas included in here are not fully baked into the standards and might be controversial in nature. The hope here is to demonstrate a plausible SDP composition to enchance seamless inter-operability between the aforementioned communication systems.

TOC

6.1. Secure Two-Way Audio,Video w/Feedback - WebRTC <-> Legacy Interop

In the scenario desribed below, Alice sends **[RFC3264]** Offer with two sets of media descriptions per media type.

One set that correponds to **[WEBRTC]** Compliant RTP/SAVPF based audio and video descriptions.

Another set with RTP/AVP based audio and video descriptions for the legacy Interop purposes.

Also to note, Alice includes session level DTLS information and media level RTCP feedback information as applicable to both the sets of media descriptions

On the other hand, Bob being a Legacy VOIP end-point, recognizes only the media descriptions with RTP/AVP as the application protocol. The security and fedback requirements for the session are either handled by a intermediate gateway or with some combination of Bob's capabilities and the intermediate gateway.

Changes from draft-nandakumar-rtcweb-sdp-00

- Fixed editorial comments on the mailing list.
- Updated Data-channel SDP information based on draft-ietf-mmusic-sctp-sdp.
- Updated BUNDLE examples based on draft-ietf-mmusic-sdp-bundle-negotiation.
- Added examples for few more BUNDLE variants
- Added new examples for Simulcast and SVC
